#### Abstract

For the p-Laplacian wave equation with logarithmic nonlinearity of initial value problem is analyzed. Focusing on the interplay between damped term and logarithmic source, we discuss the local existence of solutions.

Keywords: Existence, logarithmic nonlinearity.

## 1. INTRODUCTION

In this paper, we consider the following the p-Laplacian equation with logarithmic nonlinearity
$\begin{cases}u_{t t}-\operatorname{div}\left(|\nabla u|^{p-2} \nabla u\right)-\Delta u+u_{t}=k u \ln |u|, & x \in \Omega, t>0 \\ u(x, 0)=u_{0}(x), \quad u_{t}(x, 0)=u_{1}(x), & x \in \Omega, \\ u(x, t)=\frac{\partial}{\partial v} u(x, t)=0, & x \in \partial \Omega, t>0,\end{cases}$
where $\Omega \subset R^{n}(n \leq p)$ is a bounded domain with smooth boundary $\partial \Omega, p>2$ is a costant number and $k$ is the smallest positive constant.

Studies of logarithmic nonlinearity have a long history in physics as it occurs naturally in inflation cosmology, quantum mechanics and nuclear physics [2,3,6]. There is a lot of reference in the literature which interested in applications of logarithmic nonlinerity. The first well known working is introduced by [1] . Later, the motivated of this working a lot mathematicians studied different problem with logarithmic source term see $[4,8,16,13,14,12]$.

Messaoudi, [11] studied the following problem
$u_{t t}-\operatorname{div}\left(|\nabla u|^{p-2} \nabla u\right)-\Delta u_{t}+\left|u_{t}\right|^{q-1} u_{t}=|u|^{p-1} u$.
He studied decay of solutions of the problem (2) using the techniques combination of the perturbed energy and potential well methods. Then the problem (2) was studied by Wu and Xue [17] and Pişkin [15].

In [9], Nhan and Truong considered

[^0]$u_{t}-\operatorname{div}\left(|\nabla u|^{p-2} \nabla u\right)-\Delta u_{t}=|u|^{p-2} u \ln |u|$,
and established the global existence, blow up and deca y of solutions for $p>2$. The problem (3) was studied by Cao and Liu [5], they proved global boundedness and also blowing-up at infinity for $1<p<2$.

The present of our paper is organized as follows: Firstly, we give some notations and lemmas which will be used throughout this paper. In the last section, we established the local existence of the solutions the problem.

## 2. PRELIMINARIES

In this section we will give some notations and lemmas which will be used throughout this paper. For simplify notations, throughout this paper, we adopt the following abbreviations:

$$
\|u\|_{p}=\|u\|_{L^{p}(\Omega)},\|u\|_{2}=\|u\| \text { and }\|u\|_{1, p}=\|u\|_{\left.W_{0}^{1, p} \Omega\right)}=\left(\|u\|_{p}+\|\nabla u\|_{p}\right)^{\frac{1}{p}}
$$

for $2<p$. We denote by $C$ and $C_{i}=(i=1,2, \ldots)$ various positive constants.
(A) The constant $k$ in (1) satisfies $0<k<k_{1}$ where $k$ is the positive real number satisfying $e^{-\frac{3}{2}}=\sqrt{\frac{2 \pi}{k_{1}}}$.

Remark 1 The function $f(s)=\sqrt{\frac{2 \pi}{s}}-e^{-\frac{3}{2}}$ is a continuous and decreasing function on $(0, \infty)$, with

$$
\lim _{s \rightarrow 0^{+}} f(s)=\infty, \quad \lim _{s \rightarrow \infty} f(s)=-e^{-\frac{3}{2}}
$$

Then there exist a unique $k_{1}>0$ such that $f\left(k_{1}\right)=0$.
Therefore;

$$
e^{-\frac{3}{2}}<\sqrt{\frac{2 \pi}{s}}, \forall s \in\left(0, k_{1}\right)
$$

We define energy function as follows
$E(t)=\frac{1}{2}\left\|u_{t}\right\|^{2}+\frac{1}{p}\|\nabla u\|_{p}^{p}+\frac{1}{2}\|\nabla u\|^{2}-\frac{k}{2} \int_{\Omega} \ln |u| u^{2} d x+\frac{k}{4}\|u\|^{2}$.
Lemma $2 E(t)$ is a nonincreasing function of $t \geq 0$
$E^{\prime}(t)=-\left\|u_{t}\right\|^{2} \leq 0$.
Proof. We show that $E^{\prime}(t)=-\left\|u_{t}\right\|^{2} \leq 0$. Multiplying the equation (1) by $u_{t}$ and integrating on $\Omega$ we have

$$
\begin{gathered}
\int_{\Omega} u_{t t} u_{t} d x-\int_{\Omega} d i v\left(|\nabla u|^{p-2} \nabla u\right) u_{t} d x c \\
+\int_{\Omega} \nabla u \nabla u_{t} d x+\int_{\Omega} u_{t} u_{t} d x \\
=\int_{\Omega} k u \ln |u| u_{t} d x \\
\frac{d}{d t}\left(\frac{1}{2} \int_{\Omega}\left|u_{t}\right|^{2} d x\right)+\frac{d}{d t}\left(\frac{1}{p} \int_{\Omega}|\nabla u|^{p} d x\right)+\frac{d}{d t}\left(\frac{1}{2} \int_{\Omega}|\nabla u|^{2} d x\right) \\
+\frac{d}{d t}\left(-\frac{k}{2} \int_{\Omega} \ln |u| u^{2} d x+\frac{k}{4}\|u\|^{2}\right) \\
=-\left\|u_{t}\right\|^{2} \\
\frac{d}{d t}\left[\frac{1}{2}\left\|u_{t}\right\|^{2}+\frac{1}{p}\|\nabla u\|_{p}^{p}+\frac{1}{2}\|\nabla u\|^{2}-\frac{k}{2} \int_{\Omega} \ln |u| u^{2} d x+\frac{k}{4}\|u\|^{2}\right]=-\left\|u_{t}\right\|^{2}, \\
E^{\prime}(t)=-\left\|u_{t}\right\|^{2}
\end{gathered}
$$

Lemma 3 [7] (Logarithmic Sob olev Inequality). Let $u$ be any function $u \in H_{0}{ }^{1}(\Omega)$ and $\alpha>0$ be any number

$$
\int_{\Omega} \ln |u| u^{2} d x<\frac{1}{2}\|u\|^{2} \ln \|u\|^{2}+\frac{\alpha^{2}}{2 \pi}\|\nabla u\|^{2}-(1+\ln \alpha)\|u\|^{2} .
$$

Lemma 4 [4] (Logarithmic Gronwall Inequality) Let $c>0, \gamma \in L^{1}\left(0, T, R^{+}\right)$and assume that the function $w:[0, T] \rightarrow[1, \infty]$ satisfies

$$
w(t) \leq c\left(1+\int_{0}^{t} \gamma(s) w(s) \ln w(s) d s\right), 0 \leq t \leq T
$$

where

$$
w(t) \leq c e^{\int_{0}^{t} c \gamma(s) d s}, 0 \leq t \leq T .
$$

## 3. LOCAL EXISTENCE

In this section we state and prove the local existence result for the problem (1). The proof is based Faedo-Galerkin method.
Definition 5 A function $u$ defined on $[0, T]$ is called a weak solution of (1) if

$$
u \in C\left([0, T): W_{0}^{1, p}(\Omega)\right), \quad u_{t} \in C\left([0, T): L^{2}(\Omega)\right)
$$

and $u$ satisfies

$$
\left\{\begin{array}{l}
\int_{\Omega} u_{t t}(x, t) w(x) d x+\int_{\Omega} \nabla u(x, t) \nabla w(x) d x \\
+\left.\int_{\Omega} \nabla u\right|^{p-2} \nabla u(x, t) \nabla w(x) d x+\int_{\Omega} u_{t}(x, t) w(x) d x \\
=k \int_{\Omega} u(x, t) \ln |u(x, t)| w(x) d x,
\end{array}\right.
$$

for $w \in H_{0}^{1}(\Omega)$.
Theorem 6 Let $\left(u_{0}, u_{1}\right) \in W_{0}^{1, p}(\Omega) \times L^{2}(\Omega)$. Then the problem (1) has a global weak solution on $[0, T]$.
Proof. We will use the Faedo-Galerkin method to construct approximate solutions. Let $\left\{w_{j}\right\}_{j=1}^{\infty}$ be an orthogonal basis of the "separable" space $\mathrm{W}_{0}^{1, p}(\Omega)$ which is orthonormal in $L^{2}(\Omega)$. Let

$$
V_{m}=\operatorname{span}\left\{w_{1}, w_{2}, \ldots, w_{m}\right\}
$$

and let the projections of the initial data on the finite dimensional subspace $V_{m}$ be given by

$$
\begin{gathered}
u_{0}^{m}(x)=\sum_{j=1}^{m} a_{j} w_{j} \rightarrow u_{0} \text { in } \mathrm{W}_{0}^{1, p}(\Omega) \\
u_{1}^{m}(x)=\sum_{j=1}^{m} b_{j} w_{j} \rightarrow u_{1} \text { in } \mathrm{L}^{2}(\Omega) \\
\text { for } j=1,2, \ldots, m .
\end{gathered}
$$

We look for the approximate solutions

$$
u^{m}(x, t)=\sum_{j=1}^{m} h_{j}^{m}(t) w_{j}(x),
$$

of the approximate problem in $V_{m}$
$\left\{\begin{array}{l}\int_{\Omega}\left(u_{t t}^{m} w+\left|\nabla u^{m}\right|^{p-2} \nabla u^{m} \nabla w+\nabla u^{m} \nabla w+u_{t}^{m} w\right) d x=k \int_{\Omega} u^{m} \ln \left|u^{m}\right| w d x, \\ u^{m}(0)=u_{0}^{m}=\sum_{j=1}^{m}\left(u_{0}, w_{j}\right) w_{j}, \\ u_{t}^{m}(0)=u_{1}^{m}=\sum_{j=1}^{m}\left(u_{1}, w_{j}\right) w_{j} .\end{array}\right.$
This leads to a system of ordinary differantial equations for unknown functions $h_{j}^{m}(t)$. Based on standard existence theory for ordinary differantial equation, one can obtain functions
$h_{j}:\left[0, t_{m}\right] \rightarrow R, j=1,2, \ldots, \mathrm{~m}$
which satisfy (6) in a maximal interval $\left[0, t_{m}\right), 0<t_{m} \leq T$. Next, we show that $t_{m}=T$ and that the local solution is uniformly bounded independent of $m$ and $t$. For this purpose, let us replace $w$ by $u_{t}^{m}$ in (6) and integrate by parts we obtain
$\frac{d}{d t} E^{m}(t)=-\left\|u_{t}^{m}\right\|^{2} \leq 0$,
where
$E^{m}(t)=\frac{1}{2}\left\|u_{t}^{m}\right\|^{2}+\frac{1}{p}\left\|\nabla u^{m}\right\|_{p}^{p}+\frac{1}{2}\left\|\nabla u^{m}\right\|^{2}$

$$
\begin{equation*}
-\frac{k}{2} \int_{\Omega}\left|u^{m}\right|^{2} \ln \left|u^{m}\right| d x+\frac{k}{4}\left\|u^{m}\right\|^{2} . \tag{9}
\end{equation*}
$$

Integrating (8) with respect to $t$ from 0 to $t$, we obtain $E^{m}(t) \leq E^{m}(0)$.

By the Logarithmic Sobolev inequality leads to
$E^{m}(t)=\frac{1}{2}\left\|u_{t}^{m}\right\|^{2}+\frac{1}{p}\left\|\nabla u^{m}\right\|_{p}^{p}+\frac{1}{2}\left\|\nabla u^{m}\right\|^{2}$
$-\frac{k}{2} \int_{\Omega}\left|u^{m}\right|^{2} \ln \left|u^{m}\right| d x+\frac{k}{4}\left\|u^{m}\right\|^{2}$,
$\geq \frac{1}{2}\left\|u_{t}^{m}\right\|^{2}+\frac{1}{p}\left\|\nabla u^{m}\right\|_{p}^{p}+\frac{1}{2}\left\|\nabla u^{m}\right\|^{2}+\frac{k}{4}\left\|u^{m}\right\|^{2}$
$-\frac{k}{2}\left[\frac{1}{2}\left\|u^{m}\right\|^{2} \ln \left\|u^{m}\right\|^{2}+\frac{\alpha^{2}}{2 \pi}\left\|\nabla u^{m}\right\|^{2}-(1+\ln \alpha)\left\|u^{m}\right\|^{2}\right]$,
$=\frac{1}{2}\left\|u_{t}^{m}\right\|^{2}+\frac{1}{p}\left\|\nabla u^{m}\right\|_{p}^{p}+\left(1-\frac{k \alpha^{2}}{2 \pi}\right)\left\|\nabla u^{m}\right\|^{2}$
$+\frac{1}{2}\left[\frac{k}{2}\left(1-\ln \left\|u^{m}\right\|^{2}\right)+k(1+\ln \alpha)\right]\left\|u^{m}\right\|^{2}$
Then, using of (10) and taking $C=2 E^{m}(0)$ we get
$\left\|u_{t}^{m}\right\|^{2}+\left(1-\frac{k \alpha^{2}}{2 \pi}\right)\left\|\nabla u^{m}\right\|^{2}$
$\frac{2}{p}\left\|\nabla u^{m}\right\|_{p}^{p}++\left(\frac{3 k}{2}+k \ln \alpha\right)\left\|u^{m}\right\|^{2}$
$\leq C+\frac{k}{2}\left\|u^{m}\right\|^{2} l n\left\|u^{m}\right\|^{2}$.
Now, choosing
$e^{-\frac{3}{2}}<\alpha<\sqrt{\frac{2 \pi}{k}}$
will make

$$
\frac{3 k}{2}+k \ln \alpha>0 \text { and } 1-\frac{k \alpha^{2}}{2 \pi}>0
$$

This selection is possible thanks to (A). So, we have
$\left\|u_{t}^{m}\right\|^{2}+\left\|\nabla u^{m}\right\|_{p}^{p}+\left\|\nabla u^{m}\right\|^{2}+\left\|u^{m}\right\|^{2}<c\left(1+\left\|u^{m}\right\|^{2} l n\left\|u^{m}\right\|^{2}\right)$.
We know that

$$
u^{m}(., t)=u^{m}(., 0)+\int_{0}^{t} \frac{\partial u^{m}}{\partial \tau}(., \tau) d \tau .
$$

Then, using Cauchy-Schwarz inequality $(a+b)^{2} \leq 2\left(a^{2}+b^{2}\right)$, we obtain

$$
\begin{align*}
& \left\|u^{m}(t)\right\|^{2}=\left\|u^{m}(., 0)+\int_{0}^{t} \frac{\partial u^{m}}{\partial \tau}(., \tau) d \tau\right\|^{2} \\
& \leq 2\left\|u^{m}(0)\right\|^{2}+2\left\|\int_{0}^{t} \frac{\partial u^{m}}{\partial \tau}(., \tau) d \tau\right\|^{2} \\
& \leq 2\left\|u^{m}(0)\right\|^{2}+2 T \int_{0}^{t}\left\|u_{t}^{m}(\tau)\right\|^{2} d \tau . \tag{15}
\end{align*}
$$

So, using of inequality (14) and (15) we get
$\left\|u^{m}(t)\right\|^{2} \leq 2\left\|u^{m}(0)\right\|^{2}+2 T c\left(1+\left\|u^{m}\right\|^{2} \ln \left\|u^{m}\right\|^{2}\right)$.
If we put $C_{1}=\max \left\{2\left\|u^{m}(0)\right\|^{2}, 2 T c\right\}$, (16) leads to

$$
\left\|u^{m}\right\|^{2} \leq 2 C_{1}\left(1+\int_{0}^{t}\left\|u^{m}\right\|^{2} \ln \left\|u^{m}\right\|^{2} d \tau\right)
$$

Without loss of generality, we take $C_{1} \geq 1$, we have

$$
\left\|u^{m}\right\|^{2} \leq 2 C_{1}\left(1+\int_{0}^{t}\left(C_{1}+\left\|u^{m}\right\|^{2}\right) \ln \left(\left(C_{1}+\left\|u^{m}\right\|^{2}\right)\right) d \tau\right)
$$

Thanks to Logarithmic Gronwall inequality, we obtain

$$
\left\|u^{m}\right\|^{2} \leq 2 C_{1} e^{2 C_{1} t}=C_{2} .
$$

Therefore, from inequality (14), it follows that

$$
\left\|u_{t}^{m}\right\|^{2}+\left\|\nabla u^{m}\right\|_{p}^{p}+\left\|\nabla u^{m}\right\|^{2}+\left\|u^{m}\right\|^{2} \leq C_{3}=C\left(1+C_{2} \ln C_{2}\right)
$$

where $C_{3}$ is a positive constant independent of $m$ and $t$. If these operations (14) are applied to each term of inequality, this implies
$\max _{t \in\left(0, t_{m}\right)}\left\|u_{t}^{m}\right\|^{2}+\max _{t \in\left(0, t_{m}\right)}\left\|\nabla u^{m}\right\|_{p}^{p}+\max _{t \in\left(0, t_{m}\right)}\left\|\nabla u^{m}\right\|^{2}+\max _{t \in\left(0, t_{m}\right)}\left\|u^{m}\right\|^{2} \leq 4 C_{3}$
So, the approximate solution is uniformly bounded independent of $m$ and $t$. Therefore, we can extend $t_{m}$ to $T$. Moreover, we obtain
$\left\{\begin{array}{l}u^{m}, \text { is uniformly bounded in } L^{\infty}\left(0, T ; W_{0}^{(1, p)}(\Omega)\right), \\ u_{t}^{m}, \text { is uniformly bounded in } L^{\infty}\left(0, T ; L^{2}(\Omega)\right) .\end{array}\right.$
Hence we can infer from (17) and (18) that there exists a subsequence of $\left(u^{m}\right)$ (still denoted by $\left(u^{m}\right)$, such that
$\left\{\begin{array}{l}u^{m} \rightarrow u, \text { weakly }^{*} \text { in } L^{\infty}\left(0, T ; W_{0}^{(1, p)}(\Omega)\right), \\ u_{t}^{m} \rightarrow u_{t}, \text { weakly }^{*} \text { in } L^{\infty}\left(0, T ; L^{2}(\Omega)\right), \\ u^{m} \rightarrow u, \text { weakly in } L^{2}\left(0, T ; H_{0}^{1}(\Omega)\right), \\ u_{t}^{m} \rightarrow u_{t}, \text { weakly in } L^{2}\left(0, T ; L^{2}(\Omega)\right) .\end{array}\right.$
Then using (19) and Aubin-Lions lemma, we have

$$
u^{m} \rightarrow u \text {, strongly in } L^{2}\left(0, T ; L^{2}(\Omega)\right)
$$

which implies

$$
u^{m} \rightarrow u, \Omega \times(0, T) .
$$

Since the map $s \rightarrow \operatorname{sln}|s|^{k}$ is continuous, we have the convergence $u^{m} \ln \left|u^{m}\right|^{k} \rightarrow u \ln |u|^{k}, \Omega \times(0, T)$.

By the Sobolev embedding theorem $\left(H_{0}^{1}(\Omega) \hookrightarrow L^{\infty}(\Omega)\right)$, it is clear that $\left.\left|u^{m} \ln \right| u^{m}\right|^{k}-$ $u \ln |u|^{k} \mid$ is bounded in $L^{\infty}(\Omega \times(0, T))$. Next, taking into account the Lebesgue bounded convergence theorem, we have
$u^{m} \ln \left|u^{m}\right|^{k} \rightarrow u \ln |u|^{k}$ strongly in $L^{2}\left(0, T ; L^{2}(\Omega)\right)$
We integrate (6) over $(0, t)$ to obtain, $\forall w \in V_{m}$

$$
\begin{gathered}
k \int_{0}^{t} \int u^{m} \ln \left|u^{m}\right| w d x d s=\int_{\Omega} u_{t}^{m} w d x-\int_{\Omega} u_{1}^{m} w d x \\
+\int_{0}^{t} \int_{\Omega}\left|\nabla u^{m}\right|^{p-2} \nabla u^{m} \nabla w d x d s \\
+\int_{0}^{t} \int_{\Omega} \nabla u^{m} \nabla w d x d s+\int_{0}^{t} \int_{\Omega} u_{t}^{m} w d x d s .
\end{gathered}
$$

Convergences (19), (21) are sufficient to pass to the limit in (22)
$\int_{\Omega} u_{t} w d x=\int_{\Omega} u_{1} w d x-\int_{0}^{t} \int_{\Omega}|\nabla u|^{p-2} \nabla u \nabla w d x d s$
$-\int_{0}^{t} \int_{\Omega} \nabla u \nabla w d x d s-\int_{0}^{t} \int_{\Omega} u_{t} w d x d s \int+k \int_{0}^{t} \int_{\Omega} u \ln |u| w d x d s$.
which implies that (22) is valid $\forall w \in H_{0}^{1}(\Omega)$.Using the fact that the terms in the right-hand side of (23) are absolutely continuous since they are functions of $t$ defined by integrals over $(0, t)$, hence it is differentiable for a.e. $t \in R^{+}$. Thus, differentiating (23), we obtain, for a.e. $t \in(0, T)$ and any $\forall w \in H_{0}^{1}(\Omega)$,

$$
\begin{gather*}
\int_{\Omega} u(x, t) \ln |u(x, t)|^{k} w(x, t) d x=\int_{\Omega} u_{t t}(x, t) w(x) d x \\
+\int_{\Omega}|\nabla u|^{p-2} \nabla u(x, t) \nabla w(x) \\
+\int_{\Omega} \nabla u(x, t) \nabla w(x) d x \\
+\int_{\Omega} u_{t}(x, t) w(x) d x \tag{23}
\end{gather*}
$$

If we take initial data, we note that

$$
\begin{aligned}
& u^{m} \rightarrow u, \text { weakly in } L^{2}\left(0, T ; W_{0}^{(1, p)}(\Omega)\right), \\
& u_{t}^{m} \rightarrow u_{t}, \text { weakly in } L^{2}\left(0, T ; L^{2}(\Omega)\right)
\end{aligned}
$$

Thus, using Lion's Lemma [10], we have

$$
u^{m} \rightarrow u, \text { in } C\left([0, T] ; L^{2}(\Omega)\right) .
$$

Therefore, $u^{m}(x, 0)$ makes sense and

$$
u^{m}(x, 0) \rightarrow u(x, 0), \text { in } L^{2}(\Omega)
$$

We have

$$
u^{m}(x, 0) \rightarrow u_{0}(x, 0), \operatorname{in}\left(H_{0}^{1}(\Omega) \cap L^{p}(\Omega)\right)
$$

Hence

$$
u(x)=u_{0}(x)
$$

Now, multiply (6) by $\varphi \in C_{0}^{\infty}(0, T)$ and integrate over ( $0, T$ ), we obtain for $\forall w \in V_{m}$, and because of

$$
\left.\left(u_{t}^{m}\right\} \varphi(t)\right)^{\prime}=u_{t t}^{m} \varphi(t)+u^{m} \varphi^{\prime}(t)
$$

we get

$$
\begin{gathered}
-\int_{0}^{t} \int_{\Omega} u_{t}^{m} w \varphi^{\prime}(t) d x=\int_{0}^{t} \int_{\Omega}\left|\nabla u^{m}\right|^{p-2} \nabla u^{m} \nabla w \varphi(t) d x d t \\
-\int_{0}^{t} \int_{\Omega} \nabla u^{m} \nabla w \varphi(t) d x d t-\int_{0}^{t} \int_{\Omega} u_{t}^{m} w \varphi(t) d x d t \\
+k \int_{0}^{t} \int_{\Omega} u^{m} \ln \left|u^{m}\right| w \varphi(t) d x d t .
\end{gathered}
$$

As $\rightarrow \infty$, we have for $\forall w \in H_{0}^{1}(\Omega)$ and $\varphi \in C_{0}^{\infty}(0, T)$

$$
\begin{gathered}
-\int_{0}^{t} \int_{\Omega} u_{t} w \varphi^{\prime}(t) d x=\int_{0}^{t} \int_{\Omega}|\nabla u|^{p-2} \nabla u \nabla w \varphi(t) d x d t \\
-\int_{0}^{t} \int_{\Omega} \nabla u \nabla w \varphi(t) d x d t-\int_{0}^{t} \int_{\Omega} u_{t} w \varphi(t) d x d t \\
+k \int_{0}^{t} \int_{\Omega} u l n|u| w \varphi(t) d x d t .
\end{gathered}
$$

This means

$$
u_{t t} \in L^{2}[0, T), H^{-2}(\Omega),
$$

on the other hand, because of

$$
u_{t t} \in L^{2}[0, T), L^{2}(\Omega)
$$

we obtain

$$
u_{t t} \in C[0, T), H^{-2}(\Omega) .
$$

So that

$$
u_{t}^{m}(x, 0) \rightarrow u_{t}(x, 0), H^{-2}(\Omega),
$$

but

$$
u_{t}^{m}(x, 0)=u_{1}^{m}(x) \rightarrow u^{1}(x), L^{2}(\Omega)
$$

Hence

$$
u_{t}(x, 0)=u_{1}(x) .
$$

This finished the proof of the theorem.
Conflict of interest The authors declare that they have no conflict of interest.
